

CMS Hosting

What is CMS?

A website content management system is a software solution that will help you manage your website content. Using it you can create, update and manage the website using a "Microsoft word" like interface. You can create web pages without knowing HTML or any design tools.

The main advantages of using the Joomla CMS software are:

- Cut web site creation and maintenance costs
- Create and update the website quickly easily
- No need to rely on programmers or designers for the website
- Fast updating of the site
- Uniform site look
- Search Engine Optimized website
- Improved site navigation
- Increased security of content and site pages
- Adapt quickly to market needs
- Take control

Most websites designed prior to the new millennium were created using expensive software packages requiring a deal of time, cost and expertise to put even the most basic functions into your website. Design consultations and other fee-for-service charges resulted in "average" websites costing in the thousands of dollars. To make matters even worse, the regular alterations required to keeping a website fresh and dynamic added further costs and delays. The natural result to this regime has been seen in the huge number of websites that haven't been updated in years. Imagine what that says to your customers about how you conduct your business.

Content Managed Software (CMS) allows anyone with the most basic computer knowledge to manage the content of their own website. Because the software is built into the website itself, you don't even need your own computer to create and edit text or upload photos.

You can even put your brochures online saving you thousands of dollars in printing costs!!!

VITILit will insure that your website is a business tool. It is there to control and focus your company's exposure thus attracting profitable inquiry. Call now on 1300 552 166 or [click here](#) and fill in our enquiries form.
